Tips Guide

ClinicalKey Nursing AI uses generative AI to give you trusted, evidence-based answers through conversational search. Use these tips to get the most out of it.

Prompt tips

Give details	Ask a clinical question with patient context, nursing role, and care setting. **Example:** *What nursing assessments should I prioritize for an older adult post-op hip fracture patient with mild confusion, a Foley catheter, and oxygen 2 L/min by nasal cannula?*
Ask for guidance, not decisions	Ask for nursing assessments, interventions, monitoring, or escalation cues. **Example:** *For a patient with pneumonia on 4 L/min oxygen who is becoming more short of breath, what assessment findings should concern me?*
Ask like you are consulting a colleague	Phrase the question like you would ask a senior nurse, preceptor, educator, or clinical specialist. **Example:** *I am caring for a patient with new confusion and possible sepsis and have orders for blood cultures. How do I determine the best sites to use to draw the cultures?*
Expand your knowledge	Ask for follow-up learning when the answer reveals a knowledge gap. **Example:** Following a query about treatment of hyperkalemia, you might ask: *It seems contradictory to use insulin and dextrose together. How does this medication combination work to treat hyperkalemia?*
